Working with units in code

How we used to keep track of units in code:

```
speed = 100 \cdot \# km/s
speed_kms = 100 \cdot
```

- implicit
- doesn't scale well
- operations don't carry units

Store, convert, display units in code

Key concepts: Unit objects

Quantity objects

Physical types

Constants

Unit objects

Quantity objects

Physical types

Constants

- objects that represent units
- includes base units (e.g., meter)
- also all SI prefixes (e.g., kilometer, ...)
- mostly used through the Quantity object

```
>>> import astropy.units as u
>>> u.meter
>>> u.m
>>> u.kilometer
>>> u.km
```

Unit objects

Quantity objects

Physical types

Constants

- number or array * unit = Quantity
- represents a value or array of values with units
- can convert to other equivalent units

```
>>> q1 = 15 * u.meter
>>> q2 = [4., 8., 15., 16.] * u.km
>>> q2.to(u.femtometer)
```

Unit objects

Quantity objects

Physical types

Constants

- most units have a physical type
 - e.g., meter is a 'length', a Newton is a 'force'
- quantities can always be converted to a unit with the same physical type

astropy.constants

Unit objects

Quantity objects

Physical types

Constants

- constants are special quantity-like objects
 - e.g., gravitational G, speed of light c
- some constants are also implemented as units,
 e.g., solar mass

```
>>> from astropy.constants import G, c
>>> Rsch = 2 * G * (1*u.Msun) / c**2
>>> Rsch.to(u.earthRad)
<Quantity 0.0004630297543312663 earthRad>
```

Unit objects

Quantity objects

Physical types

Constants

Equivalencies

• unit conversions also support *equivalency* conversions, e.g., from wavelength to frequency

```
>>> (5577.*u.Angstrom).to(u.THz)
>>> (5577.*u.Angstrom).to(u.THz, u.spectral())
<Quantity 537.5514757037834 THz>
```

Unit objects

Quantity objects

Physical types

Constants

Equivalencies

• unit conversions also support *equivalency* conversions, e.g., from wavelength to frequency

```
fails: length → frequency

>>> <u>(5577.*u.Angstrom).to(u.THz)</u>

>>> (5577.*u.Angstrom).to(u.THz, u.spectral())

<Quantity 537.5514757037834 THz>
```
